

MOLD

ADVANCED APPROACH

The existence of mold can pose serious health risks to those exposed and can cause structural damage to the building. High moisture areas create a breeding ground for mold to grow and spread. Disinfectants can't keep up. They stop working when they dry and do not provide long-term protection.

That is where the KLEAN company comes in. KLEAN stops the growth of mold, fungi, mildew, and the spread of bacteria. Unlike other mold remediation products, KLEAN kills existing mold and then prevents future mold growth. Upon application, KLEAN's innovative solution creates an active barrier that kills mold, fungi, and bacteria on contact for an extended period.

Long-Term Protection

KLEAN's surface solution kills bacteria, fungi and mold on contact and continues to kill for at least 90 days. Proven in an active hospital over four years.

Alcohol-Free

KLEAN solutions are chemical-free, alcohol-free, and water-based so only poses a threat to bacteria, fungi & mold.

Non-Toxic & Safe

KLEAN's surface solution is EPA approved, meets FDA standards, and improves air quality by reducing airborne pathogens.

PREVENTION IS KEY

The average adult can touch as many as 30 objects every 60 seconds, including high-traffic surfaces like doorknobs, switches, chairs, tables and more. Traditional disinfectants work until they dry and then they are useless. KLEAN's solution creates an active barrier that kills mold, mildew, fungi, and bacteria on contact and continues to work after it dries. On porous and non-porous surfaces, KLEAN continues to kill for 90 days. **KLEAN's goal is to significantly reduce preventable mold.**

Your family, guests and visitors deserve a healthy environment that protects them from preventable harm. For maximum protection, we recommend an *Infection Control Program* focused on prevention.

Sept 2017

Post treatment, power washed dead mold off and then sprayed with KLEAN's surface protectant.

Apr 2019

No additional KLEAN Treatments.

Oct 2020

No additional KLEAN Treatments.

April 2022

Major freeze Feb 2021. The brick was washed & treated with KLEAN.

PROVEN PROTECTION FOR FAMILY, STAFF & VISITORS

Take a proactive approach to mold with KLEAN's preventative surface barrier solution. KLEAN forms a surface barrier on treated solutions (interior and exterior) that continues to protect long after it dries. KLEAN solutions create a surface barrier consisting of barbs and strong electrical fields on treated surfaces. When a mold spore, mildew, fungi or bacteria encounter this surface barrier, the barbs puncture the cell walls and the electrical field tears the cell apart, rendering it harmless. This unique durable nano-coating provides long-lasting antimicrobial protection.

"The KLEANcompany crew came to our store and explained the science and benefits of their solution. They treated the entire store after a flood, attic to slab (according to protocol) twice. The results were conclusive. We received our Certificate of Mold Remediation (CMDR) after the first clearance. Peace of mind!

The results were conclusive. We received our Certificate of Mold Remediation (CMDR) after the first clearance. Peace of mind!

-KLEAN customer (Business Owner)

KLEAN CERTIFICATION

KLEAN's Certification Program includes training on practices and protocols that support a higher level of cleanliness as specified by the CDC. This includes dedicated training on the proper application of KLEAN solutions backed by KLEAN science.

Step 01

AMBIENT SUPPRESSION OF MOLD

Air Quality

The first critical step is to improve the air quality for occupants and workers to minimize their health risks. Applied pre-demolition, the first application is designed to reduce aerial bio-contaminant exposure; resulting in clean, breathable air. This step also reduces contaminants from circulating around the building and growing in new areas.

Step 02

STRUCTURAL BARRIER

Containment

It's important to treat both affected and non-affected surfaces to completely eliminate the existence of mold. Applied post-demolition and before new construction, KLEAN eliminates existing threats and creates a surface barrier on treated surfaces for long-term protection against new threats.

Step 03

SURFACE BARRIER

Residual Protection

To maximize your protection, KLEAN's certified professionals treat all porous and non-porous surfaces post-reconstruction to ensure a complete layer of defense against future opportunistic pathogens. One simple treatment has proven to effectively prevent outbreaks for a minimum of 90 days.
